

A. Hello World Program

- create a class Main.

- Print Hello, Java World!

Source code:

```
Public class Main {
```

```
    Public static void main(String[]  
                                args) {
```

```
        System.out.println("Hello, Java World")  
    }
```

```
}
```

output: Hello, Java World.

B. Variables & Data Types

Write a program demonstrating:

int, double, boolean, char, String.

- Print their values.

Source code:

```
Public class DatatypeDemo {  
    Public static void main(String[] args)
```

```
    {  
        Int age = 20;  
        double salary = 2500.65;  
        boolean isStudent = true;  
        char grade = 'A';  
        String name = "Adarsh";
```

```
        System.out.println("Int value:" + age);  
        System.out.println("Double value:" + salary);  
        System.out.println("boolean value:" + isStudent);  
        System.out.println("char value:" + grade);  
        System.out.println("String value:" + name);  
    }  
}
```

Output: Int value : 20

Double value: 2500.65

boolean value: true

char value: A

String value: Adarsh.

C. operators program.

Write a Java program showing:

- Arithmetic operators (+, -, *, /, %)
- Relational operators (>, <, ==, !=)
- Logical operators (&&, ||, !)

Source

- Arithmetic operators (>: +, -, *, /, %)

source code

```
public class Arithmetic {
```

```
    public static void main(String[] args) {
```

```
        int x = 20;
```

```
        int y = 5;
```

```
        System.out.println("x+y=" + (x+y));
```

```
        System.out.println("x-y=" + (x-y));
```

```
        System.out.println("x*y=" + (x*y));
```

```
        System.out.println("x/y=" + (x/y));
```

```
        System.out.println("x%y=" + (x%y));
```

```
    }
```

Date: _____

Output:

$$x + y = 25$$

$$x - y = 15$$

$$x * y = 100$$

$$x / y = 4$$

$$x \% y = 0$$

- Relational operators ($>$, $<$, $==$, $!=$)
- Source code.

```
public class Relational {  
    public static void main (String[] args)  
    {
```

```
        int x = 20;
```

```
        int y = 15;
```

```
        System.out.println("x is " + x + "and y  
        is " + y);
```

```
        System.out.println(x > y);
```

Date: _____

```
System.out.println(x < y);
```

```
System.out.println(x == y);
```

```
System.out.println(x != y);
```

3

3

output:

x is 20 and y is 15

true

false

false

true.

• Logical operators (&&, ||, !)

Source code.

```
public class logical {
```

```
    public static void main(String[] args) {
```

```
        System.out.println((30 > 25) && (50 > 30));
```

```
        System.out.println((30 < 25) || (50 < 30));
```

```
        System.out.println(!(30 == 25));
```

3

3

Date: _____

output:

true

false

true.

Q. User input program

Use scanner to take two numbers
and print their sum

• Source code

```
import java.util.Scanner;
```

```
public class SumProgram {  
    public static void main(String[] args)  
    {
```

```
        Scanner sc = new Scanner(System.in);  
        // Taking input from user.
```

```
        System.out.println("Enter first number:")
```

```
        int num1 = sc.nextInt();
```

Date: _____

```
System.out.print("Enter second number:");  
int num2 = sc.nextInt();
```

```
// calculating sum  
int sum = num1 + num2;
```

```
// Printing result.  
System.out.println("Sum = " + sum);
```

```
sc.close();  
}
```

```
}
```

Output:

Enter first number: 10

Enter second number: 15

Sum = 25
